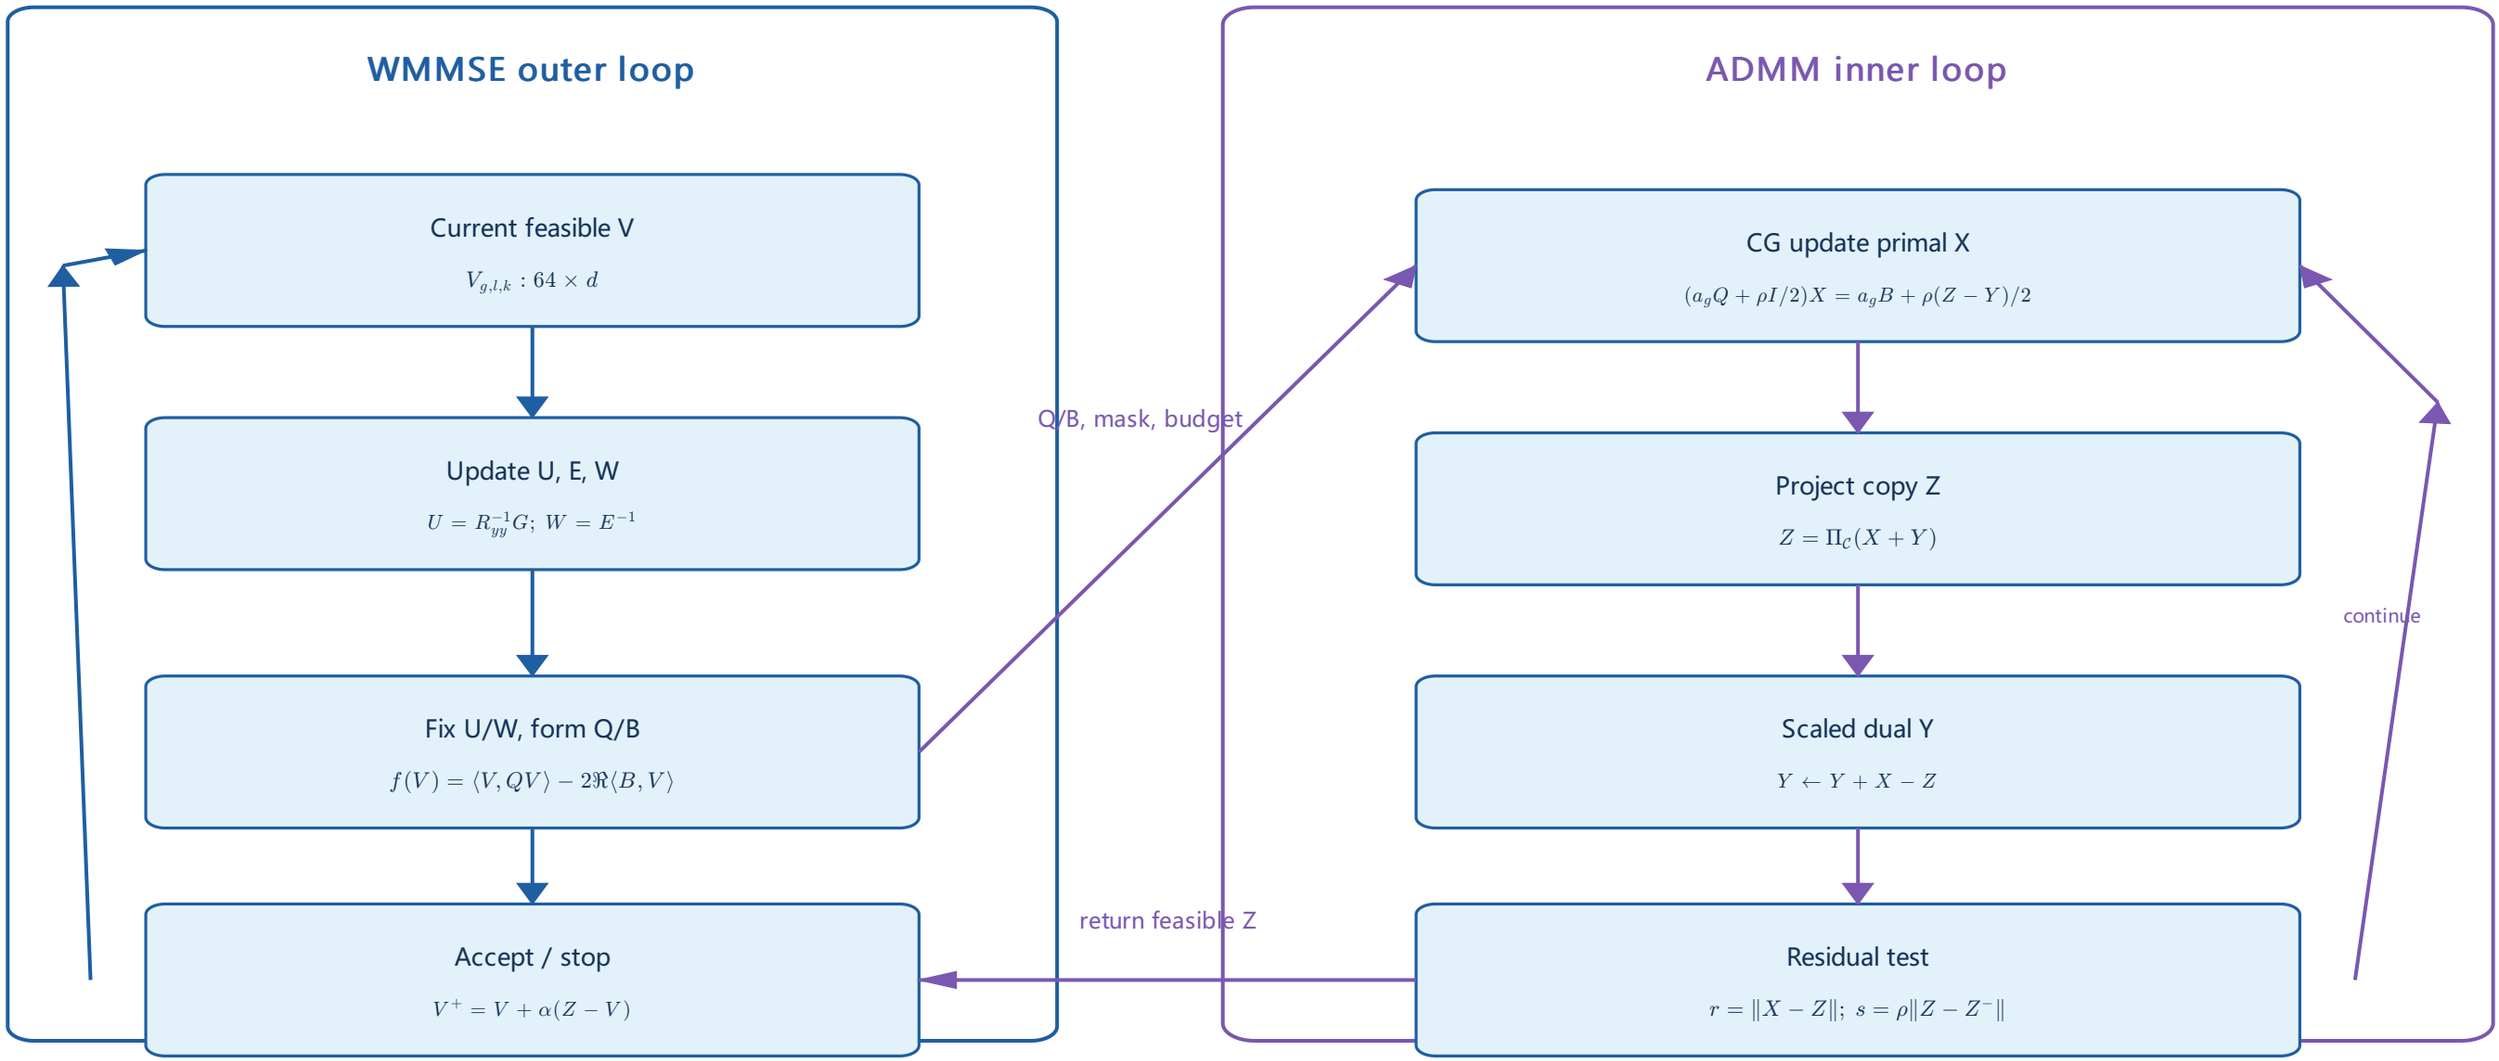
Matrix WMMSE outer loop and centralized ADMM inner loop

Service mask and rank are fixed. The returned feasible Z is checked by outer-line search; neither stop test proves global optimality.



$$\sum_g a_g \sum_k \|V_{g,l,k}\|_F^2 \le 20\,\mathrm{W} \quad \forall l$$

Power projection spans all RB groups for each TRP; fixed serve mask zeroes prohibited blocks.
